IN DEVELOPMENT

<virtual-scroller>

[DOM](#)

The <virtual-scroller> element provides a scrolling "viewport" onto some content and allows extremely large numbers of items to be displayed without impacting performance.

@property

[CSS](#)

The @property rule is an alternative way to register a custom property, without JavaScript.

Waiting for a script to register a property may not be desirable in all cases. Depending on (async) circumstance, registering a property via CSS can be faster than via JavaScript.

Accessible Object Model (AOM)

[DOM](#)

This effort aims to create a JavaScript API to allow developers to modify (and eventually explore) the accessibility tree.

Adaptive-ptime Field in RTCConfiguration

[JavaScript](#)

Adds the adaptivePtime flag to the RTCConfiguration dictionary, which indicates that the audio frame length should be adaptive.

The default audio codec in WebRTC is Opus. By default, 20ms frames are produced, meaning 50 frames per second.

Add dayPeriod option for Intl.DateTimeFormat

[JavaScript](#)

Add a dayPeriod option to Intl.DateTimeFormat() method so the caller can format times such as "7 in the morning", "11 at night", etc.

This enhances Intl.DateTimeFormat() to match what is already possible in C++ and Java by calling ICU and ICU4J. We will add a new option to the Intl.DateTimeFormat() constructor.

Add millisecondDigits option to Intl.DateTimeFormat

[JavaScript](#)

Enhance the Intl.DateTimeFormat API by adding a "millisecondDigits" option to control the format of fractions of a second.

The Date object in ECMAScript stores time information with millisecond precision. Some web developers need to output this information in a specific format.

Add quarter option for Intl.DateTimeFormat

[JavaScript](#)

Add quarter option to the Intl.DateTimeFormat() method so the caller can format dates such as "Q2 2019", "3rd quarter", etc.

This enhances Intl.DateTimeFormat() to match what is already possible in C++ and Java by calling ICU and ICU4J. We will add a new option to the Intl.DateTimeFormat() constructor.

Antialiased Clipping in Canvas

[Graphics](#)

Except as otherwise noted, the content of this page under CC Attribution 2.5 license. Code examples are Apache-2.0.
